

# Linked Lists

Victor Milenkovic

Department of Computer Science  
University of Miami

CSC220 Programming II – Spring 2016

# Outline

# Arrays are slow

# Arrays are slow

- ▶ Speed of SortedPD addOrChangeEntry:

# Arrays are slow

- ▶ Speed of SortedPD addOrChangeEntry:
  - ▶ The find method for SortedPD is  $O(\log n)$ .

# Arrays are slow

- ▶ Speed of SortedPD addOrChangeEntry:
  - ▶ The find method for SortedPD is  $O(\log n)$ .
  - ▶ But add must also insert a new entry at the index  $i$  returned by find.

# Arrays are slow

- ▶ Speed of SortedPD addOrChangeEntry:
  - ▶ The find method for SortedPD is  $O(\log n)$ .
  - ▶ But add must also insert a new entry at the index  $i$  returned by find.
  - ▶ Move all the entries from  $i$  to size  $- 1$ .

# Arrays are slow

- ▶ Speed of SortedPD addOrChangeEntry:
  - ▶ The find method for SortedPD is  $O(\log n)$ .
  - ▶ But add must also insert a new entry at the index  $i$  returned by find.
  - ▶ Move all the entries from  $i$  to size  $- 1$ .
  - ▶ That takes  $O(n)$ , which dominates the running time.

# Arrays are slow

- ▶ Speed of SortedPD addOrChangeEntry:
  - ▶ The find method for SortedPD is  $O(\log n)$ .
  - ▶ But add must also insert a new entry at the index  $i$  returned by find.
  - ▶ Move all the entries from  $i$  to size  $- 1$ .
  - ▶ That takes  $O(n)$ , which dominates the running time.
  - ▶ No hope of a fast addOrChange method for large  $n$ .

# Linked List

# Linked List

- ▶ Double Linked List

# Linked List

- ▶ Double Linked List
  - ▶ A different way of storing a list.

# Linked List

- ▶ Double Linked List
  - ▶ A different way of storing a list.
  - ▶ Allows us to add or remove an entry in  $O(1)$  time.

# Linked List

- ▶ Double Linked List
  - ▶ A different way of storing a list.
  - ▶ Allows us to add or remove an entry in  $O(1)$  time.
- ▶ The **DLLEntry** class.

# Linked List

- ▶ Double Linked List
  - ▶ A different way of storing a list.
  - ▶ Allows us to add or remove an entry in  $O(1)$  time.
- ▶ The **DLLEntry class**.
  - ▶ Extends prog02.DirectoryEntry.

# Linked List

  - ▶ entry =
  - ▶ What do we set entry equal to?
- ▶ The loop should return when it finds Hal,
  - ▶ but what if Hal is not there?
  - ▶ What will stop the loop?
  - ▶ What value of entry tells us that we have seen everything in the list?

## Removing an entry

## Removing an entry

- ▶ `removeEntry`

## Removing an entry

- ▶ removeEntry
  - ▶ calls find("Hal") to find its entry in the list.

# Removing an entry

- ▶ removeEntry
  - ▶ calls find("Hal") to find its entry in the list.
  - ▶ Then it sets variables next and previous.

# Removing an entry

- ▶ removeEntry
  - ▶ calls find("Hal") to find its entry in the list.
  - ▶ Then it sets variables next and previous.
  - ▶ How does it set them?

# Removing an entry

- ▶ removeEntry
  - ▶ calls find("Hal") to find its entry in the list.
  - ▶ Then it sets variables next and previous.
  - ▶ How does it set them?
- ▶ Next removeEntry must tell Zoe's entry to use Ann's entry as its next entry.

## Removing an entry

- ▶ removeEntry
  - ▶ calls find("Hal") to find its entry in the list.
  - ▶ Then it sets variables next and previous.
  - ▶ How does it set them?
- ▶ Next removeEntry must tell Zoe's entry to use Ann's entry as its next entry.
  - ▶ What method sets Zoe's next entry pointer?

# Removing an entry

- ▶ removeEntry
  - ▶ calls find("Hal") to find its entry in the list.
  - ▶ Then it sets variables next and previous.
  - ▶ How does it set them?
- ▶ Next removeEntry must tell Zoe's entry to use Ann's entry as its next entry.
  - ▶ What method sets Zoe's next entry pointer?
  - ▶ How do we invoke it?

# Removing an entry

- ▶ removeEntry
  - ▶ calls find("Hal") to find its entry in the list.
  - ▶ Then it sets variables next and previous.
  - ▶ How does it set them?
- ▶ Next removeEntry must tell Zoe's entry to use Ann's entry as its next entry.
  - ▶ What method sets Zoe's next entry pointer?
  - ▶ How do we invoke it?
  - ▶ What value do we give it?

# Removing an entry

- ▶ removeEntry
  - ▶ calls find("Hal") to find its entry in the list.
  - ▶ Then it sets variables next and previous.
  - ▶ How does it set them?
- ▶ Next removeEntry must tell Zoe's entry to use Ann's entry as its next entry.
  - ▶ What method sets Zoe's next entry pointer?
  - ▶ How do we invoke it?
  - ▶ What value do we give it?
  - ▶ Similarly Ann's must point back to Zoe's.

# Removing an entry

- ▶ removeEntry
  - ▶ calls find("Hal") to find its entry in the list.
  - ▶ Then it sets variables next and previous.
  - ▶ How does it set them?
- ▶ Next removeEntry must tell Zoe's entry to use Ann's entry as its next entry.
  - ▶ What method sets Zoe's next entry pointer?
  - ▶ How do we invoke it?
  - ▶ What value do we give it?
  - ▶ Similarly Ann's must point back to Zoe's.
- ▶ At this point Hal thinks he is still in the list,

# Removing an entry

- ▶ removeEntry
  - ▶ calls find("Hal") to find its entry in the list.
  - ▶ Then it sets variables next and previous.
  - ▶ How does it set them?
- ▶ Next removeEntry must tell Zoe's entry to use Ann's entry as its next entry.
  - ▶ What method sets Zoe's next entry pointer?
  - ▶ How do we invoke it?
  - ▶ What value do we give it?
  - ▶ Similarly Ann's must point back to Zoe's.
- ▶ At this point Hal thinks he is still in the list,
  - ▶ but he really isn't.

# Removing an entry

- ▶ removeEntry
  - ▶ calls find("Hal") to find its entry in the list.
  - ▶ Then it sets variables next and previous.
  - ▶ How does it set them?
- ▶ Next removeEntry must tell Zoe's entry to use Ann's entry as its next entry.
  - ▶ What method sets Zoe's next entry pointer?
  - ▶ How do we invoke it?
  - ▶ What value do we give it?
  - ▶ Similarly Ann's must point back to Zoe's.
- ▶ At this point Hal thinks he is still in the list,
  - ▶ but he really isn't.
  - ▶ Everyone is ignoring him!

# Removing an entry

- ▶ removeEntry
  - ▶ calls find("Hal") to find its entry in the list.
  - ▶ Then it sets variables next and previous.
  - ▶ How does it set them?
- ▶ Next removeEntry must tell Zoe's entry to use Ann's entry as its next entry.
  - ▶ What method sets Zoe's next entry pointer?
  - ▶ How do we invoke it?
  - ▶ What value do we give it?
  - ▶ Similarly Ann's must point back to Zoe's.
- ▶ At this point Hal thinks he is still in the list,
  - ▶ but he really isn't.
  - ▶ Everyone is ignoring him!
  - ▶ Similar to entries in array with index bigger than size.

# Adding Hal

# Adding Hal

- ▶ How do we add Hal back again?

# Adding Hal

- ▶ How do we add Hal back again?
  - ▶ Let's just put him at the end.

# Adding Hal

- ▶ How do we add Hal back again?
  - ▶ Let's just put him at the end.
  - ▶ Three values have to change for this to happen.

# Adding Hal

- ▶ How do we add Hal back again?
  - ▶ Let's just put him at the end.
  - ▶ Three values have to change for this to happen.
  - ▶ Which values?

# Adding Hal

- ▶ How do we add Hal back again?
  - ▶ Let's just put him at the end.
  - ▶ Three values have to change for this to happen.
  - ▶ Which values?
  - ▶ How do we set them?

# Adding Hal

- ▶ How do we add Hal back again?
  - ▶ Let's just put him at the end.
  - ▶ Three values have to change for this to happen.
  - ▶ Which values?
  - ▶ How do we set them?
  - ▶ To what?

## SortedDLLPD find and add

## SortedDLLPD find and add

- ▶ SortedDLLPD find must tell us where to put Hal if he is not there.

## SortedDLLPD find and add

- ▶ SortedDLLPD find must tell us where to put Hal if he is not there.
  - ▶ In that case it returns the entry after Hal.

## SortedDLLPD find and add

- ▶ SortedDLLPD find must tell us where to put Hal if he is not there.
  - ▶ In that case it returns the entry after Hal.
  - ▶ How does it know it has reached this entry?

## SortedDLLPD find and add

- ▶ SortedDLLPD find must tell us where to put Hal if he is not there.
  - ▶ In that case it returns the entry after Hal.
  - ▶ How does it know it has reached this entry?
  - ▶ What does it return if we were adding Zora?

## SortedDLLPD find and add

- ▶ SortedDLLPD find must tell us where to put Hal if he is not there.
  - ▶ In that case it returns the entry after Hal.
  - ▶ How does it know it has reached this entry?
  - ▶ What does it return if we were adding Zora?
- ▶ SortedDLLPD add uses the output of find.

## SortedDLLPD find and add

- ▶ SortedDLLPD find must tell us where to put Hal if he is not there.
  - ▶ In that case it returns the entry after Hal.
  - ▶ How does it know it has reached this entry?
  - ▶ What does it return if we were adding Zora?
- ▶ SortedDLLPD add uses the output of find.
  - ▶ It sets the variable next to the entry that should be next after Hal.

## SortedDLLPD find and add

- ▶ SortedDLLPD find must tell us where to put Hal if he is not there.
  - ▶ In that case it returns the entry after Hal.
  - ▶ How does it know it has reached this entry?
  - ▶ What does it return if we were adding Zora?
- ▶ SortedDLLPD add uses the output of find.
  - ▶ It sets the variable next to the entry that should be next after Hal.
  - ▶ How does it set next? (Easy!!)

## SortedDLLPD find and add

- ▶ SortedDLLPD find must tell us where to put Hal if he is not there.
  - ▶ In that case it returns the entry after Hal.
  - ▶ How does it know it has reached this entry?
  - ▶ What does it return if we were adding Zora?
- ▶ SortedDLLPD add uses the output of find.
  - ▶ It sets the variable next to the entry that should be next after Hal.
  - ▶ How does it set next? (Easy!!)
  - ▶ It sets the variable previous to the entry that should be before Hal.

## SortedDLLPD find and add

- ▶ SortedDLLPD find must tell us where to put Hal if he is not there.
  - ▶ In that case it returns the entry after Hal.
  - ▶ How does it know it has reached this entry?
  - ▶ What does it return if we were adding Zora?
- ▶ SortedDLLPD add uses the output of find.
  - ▶ It sets the variable next to the entry that should be next after Hal.
  - ▶ How does it set next? (Easy!!)
  - ▶ It sets the variable previous to the entry that should be before Hal.
  - ▶ How does it set previous? (A little harder.)

## SortedDLLPD find and add

- ▶ SortedDLLPD find must tell us where to put Hal if he is not there.
  - ▶ In that case it returns the entry after Hal.
  - ▶ How does it know it has reached this entry?
  - ▶ What does it return if we were adding Zora?
- ▶ SortedDLLPD add uses the output of find.
  - ▶ It sets the variable next to the entry that should be next after Hal.
  - ▶ How does it set next? (Easy!!)
  - ▶ It sets the variable previous to the entry that should be before Hal.
  - ▶ How does it set previous? (A little harder.)
- ▶ To insert new entry Hal between next and previous, add has to set four pointers.

## SortedDLLPD find and add

- ▶ SortedDLLPD find must tell us where to put Hal if he is not there.
  - ▶ In that case it returns the entry after Hal.
  - ▶ How does it know it has reached this entry?
  - ▶ What does it return if we were adding Zora?
- ▶ SortedDLLPD add uses the output of find.
  - ▶ It sets the variable next to the entry that should be next after Hal.
  - ▶ How does it set next? (Easy!!)
  - ▶ It sets the variable previous to the entry that should be before Hal.
  - ▶ How does it set previous? (A little harder.)
- ▶ To insert new entry Hal between next and previous, add has to set four pointers.
  - ▶ What are they?

## SortedDLLPD find and add

- ▶ SortedDLLPD find must tell us where to put Hal if he is not there.
  - ▶ In that case it returns the entry after Hal.
  - ▶ How does it know it has reached this entry?
  - ▶ What does it return if we were adding Zora?
- ▶ SortedDLLPD add uses the output of find.
  - ▶ It sets the variable next to the entry that should be next after Hal.
  - ▶ How does it set next? (Easy!!)
  - ▶ It sets the variable previous to the entry that should be before Hal.
  - ▶ How does it set previous? (A little harder.)
- ▶ To insert new entry Hal between next and previous, add has to set four pointers.
  - ▶ What are they?
  - ▶ What method do we use?

## SortedDLLPD find and add

- ▶ SortedDLLPD find must tell us where to put Hal if he is not there.
  - ▶ In that case it returns the entry after Hal.
  - ▶ How does it know it has reached this entry?
  - ▶ What does it return if we were adding Zora?
- ▶ SortedDLLPD add uses the output of find.
  - ▶ It sets the variable next to the entry that should be next after Hal.
  - ▶ How does it set next? (Easy!!)
  - ▶ It sets the variable previous to the entry that should be before Hal.
  - ▶ How does it set previous? (A little harder.)
- ▶ To insert new entry Hal between next and previous, add has to set four pointers.
  - ▶ What are they?
  - ▶ What method do we use?
  - ▶ For each of the four times, how do we call it and what is the value?

Keep it simple

# Keep it simple

- ▶ Keep each line of your program simple

# Keep it simple

- ▶ Keep each line of your program simple
- ▶ It should involve at most two variables.

# Keep it simple

- ▶ Keep each line of your program simple
- ▶ It should involve at most two variables.
- ▶ For example:

# Keep it simple

- ▶ Keep each line of your program simple
- ▶ It should involve at most two variables.
- ▶ For example:
  - ▶ `entry = head;`

# Keep it simple

- ▶ Keep each line of your program simple
- ▶ It should involve at most two variables.
- ▶ For example:
  - ▶ `entry = head;`
  - ▶ `previous = next.getPrevious();`

# Keep it simple

- ▶ Keep each line of your program simple
- ▶ It should involve at most two variables.
- ▶ For example:
  - ▶ `entry = head;`
  - ▶ `previous = next.getPrevious();`
  - ▶ `entry.setNext(next);`

# Keep it simple

- ▶ Keep each line of your program simple
- ▶ It should involve at most two variables.
- ▶ For example:
  - ▶ `entry = head;`
  - ▶ `previous = next.getPrevious();`
  - ▶ `entry.setNext(next);`
  - ▶ `if (next == null)`

# Keep it simple

- ▶ Keep each line of your program simple
- ▶ It should involve at most two variables.
- ▶ For example:
  - ▶ `entry = head;`
  - ▶ `previous = next.getPrevious();`
  - ▶ `entry.setNext(next);`
  - ▶ `if (next == null)`
- ▶ Of course you will use `getNext`, `setPrevious`, and other variable names!

# Keep it simple

- ▶ Keep each line of your program simple
- ▶ It should involve at most two variables.
- ▶ For example:
  - ▶ `entry = head;`
  - ▶ `previous = next.getPrevious();`
  - ▶ `entry.setNext(next);`
  - ▶ `if (next == null)`
- ▶ Of course you will use `getNext`, `setPrevious`, and other variable names!
- ▶ And the three parts of a for-loop control should each be considered a “line”:

- ▶ One step forward, two steps back!

# Summary

# Summary

- ▶ The *(doubly) linked list* is a new way to store a list.

# Summary

- ▶ The *(doubly) linked list* is a new way to store a list.
  - ▶ Adding or removing an entry *at a known location* is  $O(1)$ ,

# Summary

- ▶ The *(doubly) linked list* is a new way to store a list.
  - ▶ Adding or removing an entry *at a known location* is  $O(1)$ ,
  - ▶ in contrast to  $O(n)$  for an array.

# Summary

- ▶ The *(doubly) linked list* is a new way to store a list.
  - ▶ Adding or removing an entry *at a known location* is  $O(1)$ ,
  - ▶ in contrast to  $O(n)$  for an array.
  - ▶ But getting to the  $i$ th element takes  $O(n)$ ,
